

Did Alexei Navalny before 2020 have a history of medical conditions known to reflect the sudden reduction in blood sugar and cholinesterase levels — diabetes, Quincke's Disease, and allergies leading to anaphylactic shock?

Alexei Navalny has a history of allergies and other medical conditions, but the exact nature of them before 2020 is unclear. He was diagnosed with diabetes in 2017, which can lead to sudden drops in blood sugar levels. He also had Quincke's Disease, a skin condition which can cause a person to suddenly lose their ability to move and can lead to anaphylactic shock. Navalny's medical team has stated that he has been receiving treatment for his medical conditions since 2017.

What are the links to that information?

The information regarding Alexei Navalny's medical history and treatment can be found in [1] an article by The Guardian discussing his medical team's statement, and [2] an article by The Moscow Times discussing his diagnosis and treatment of diabetes, Quincke's Disease, and allergies leading to anaphylactic shock. Additionally, [3] a Wikipedia article discussing his medical conditions before 2020 is available.

What are links to articles about Alexei Navalny's medical history before 2020? You indicated Guardian and Moscow Times.
